PROMETEO

Development Hackathon problem statement

Description

When you visit a doctor, he/she generally needs to know about your previous medical history and records. However, these are not always readily available with the patients and when consulting various doctors for diagnosis, it is usually a cumbersome process to take all your medical records and share all your medical history with him.

Problem Statement

The teams are expected to develop a solution to store all the medical records along with doctors comments in an organised way, which can be accessed by the doctor only when the patient authorises. The proposed solution must be secure since, even a minor leak of personal information can create a huge problem for patient as such data is what advertising companies and scammers are after.

Thus a secure, reliable and user friendly method must be developed keeping in mind that a huge chunk of indian population lacks the know how to use complicated solutions.
